## NEBRASKA WEEKLY WEATHER AND CROP REPORT

Release 9/12/61

Week Ending 9/11/61

WEATHER Temperatures were climbing across most of Nebraska until Sunday afternoon and night when substantial cooling occurred. The average temperature ranged from around 60 degrees in the northwest to 73 in the southeast. Bridgeport reported frost and 33 degrees on the morning of the 5th. Many Panhandle stations reported 34 degrees that morning.

Scattered light rain fell during the entire period. The southeast had amounts up to four inches over the Labor Day weekend. Rain up to four inches fell in the east during the afternoon and night of the 10th.

Moderate winds and slightly above usual humidity prevailed. Many east central counties reported hail on the 5th.

CROPS Prospects for dryland corn and milo are spotted reflecting wide variations in rainfall in recent weeks. Some areas that were hurt by hot weather got relief during the week, checking further deterioration. Other areas in eastern districts were dry and prospects declined further. In the extremely dry localities, both corn and milo show firing and stunted growth. Leaf blight is reported from the extreme southeast. Prospective yields from irrigated corn show a wide range because of damage to stands and ears by rootworms and beetles. The over-all yield is not expected to reach the average, although some areas will reap a bumper crop.

Progress of corn toward maturity was slightly ahead of normal for this date. At the end of last week, a little over half of the corn crop had reached the dent stage. Close to 5 percent was rated safe from frost. Forty percent was in the dough stage and a small percentage still had not reached that stage of development. Much of the irrigated crop has had the final application of water for the season.

Light frosts in the Panhandle nipped tender vegetation and some beans. The corn crop in the North Platte Valley was nipped in spots, but fortunately most of the crop escaped and it will need a few more weeks to mature. Bean harvest is well underway with good yields in most sections.

Wheat seeding is well advanced in the west where some Panhandle localities have all their wheat seeded. Planting has not started in the southeast. For the State as a whole, about 20 percent of the wheat has been sown. Nearly 30 percent of the rye acreage and a third of the winter barley is planted. Legume seeding is about three-fourths finished. Preparation of ground for fall seeding is widespread and well advanced in most places. Rains early this week will put surface soil in good shape and assure germination of fall seedings.

The third cutting of alfalfa is about finished and close to 30 percent of the fourth cutting is complete.

Pasture feed varies considerably with a number of eastern counties reporting short pasture feed. However, moisture early this week is bringing relief, softening old feed and stimulating new fall growth. Ranges are in good condition. Hay supplies for this winter are ample although local dry spots have limited quantities.

LIVESTOCK The weather has been favorable for livestock. Production rates are good and litter sizes well above average. Flies and pink eye cause some concern. Fall marketings are gaining seasonally as more buyers enter the market. Demand for feeder cattle is fairly strong but cautious.
